

2026年武汉市九年级四调

数学第23题(3)题多种解法

(2026年武汉市四调真题)23. (本小题满分10分)

如图. 在正方形 $ABCD$ 中, E, F 分别为边 CD, BC 上的点, 且 $DE=CF$, 连接 AE, DF 交于点 G .

(1)如图(1), 求证: $AE \perp DF$;

(2)连接 CG .

①如图(2), 若 CG 平分 $\angle EGF$, 求证: $CE=DE$;

②如图(3), 连接 BG , 若 FG 平分 $\angle BGC$, 直接写出 $\frac{DE}{CE}$ 的值.

(1)

(2)

(3)

方法1: 四点共圆法

设 $CF=DE=x$, $BF=CE=1$

则 $AB=BC=CD=DA=x+1$

GF 平分 $\angle BGC$, 设 $\angle CGF=\angle BGF=\alpha$

$\angle ABF=90^\circ=\angle AGF \Rightarrow A, B, F, G$

四点同在以 AF 为直径的圆上

$\angle ECF=90^\circ=\angle EGF \Rightarrow C, E, G, F$

四点同在以 EF 为直径的圆上

$\Rightarrow \angle BAF=\angle BGF=\alpha$

$\angle CEF=\angle CGF=\alpha$

$\Rightarrow \tan \angle BAF = \tan \angle CEF$

$\Rightarrow \frac{BF}{AB} = \frac{CF}{CE}$

$\frac{1}{x} = \frac{x}{\sqrt{5}-1}$

方法2: 等腰转化法

在AG上取点H, 连接BH,

使BH=BA, 则 $\angle BAH = \angle BHA$

$\angle CEG = \angle BHG$ (等角的补角相等)

设 $CF = DE = x$, $BF = CE = 1$

则 $BH = AB = BC = CD = DA = x + 1$

GF平分 $\angle BGC$, 设 $\angle CGF = \angle BGF = \alpha$

$\angle CGE = 90^\circ - \alpha = \angle BGH$

$$\Rightarrow \triangle CEG \sim \triangle BHG \Rightarrow \frac{CE}{BH} = \frac{CG}{BG}$$

$$\text{又 } \frac{DE}{CE} = \frac{CF}{BF} = \frac{CG}{BG} \text{ (角平分线第二定理)}$$

$$\Rightarrow \frac{DE}{CE} = \frac{CE}{BA}$$

$$\Rightarrow \frac{x}{1} = \frac{1}{x+1} \Rightarrow x = \frac{\sqrt{5}-1}{2}$$

方法3: 等腰转化法

在EA的延长线上取点I, 连接BI,

使BI=BG, 则 $\angle BIG = \angle BGI$

GF平分 $\angle BGC$, 设 $\angle CGF = \angle BGF = \alpha$

$\angle CGE = 90^\circ - \alpha = \angle BGI = \angle BIG$

$AB \parallel CD \Rightarrow \angle CEG = \angle BAI$

$$\Rightarrow \triangle CEG \sim \triangle BAI \Rightarrow \frac{CE}{BA} = \frac{CG}{BI}$$

$$\text{又 } BI = BG, \frac{DE}{CE} = \frac{CF}{BF} = \frac{CG}{BG} \text{ (角平分线第二定理)}$$

$$\Rightarrow \frac{DE}{CE} = \frac{CE}{BA}$$

设 $CF = DE = x$, $BF = CE = 1$

则 $AB = BC = CD = DA = x + 1$

$$\Rightarrow \frac{x}{1} = \frac{1}{x+1} \Rightarrow x = \frac{\sqrt{5}-1}{2}$$

**方法4：等腰转化法**

在AE的延长线上取点J，连接CJ，

使CJ=CE，则 $\angle CEJ = \angle CJE$

GF平分 $\angle BGC$ ，设 $\angle CGF = \angle BGF = \alpha$

$\angle CGJ = 90^\circ - \alpha = \angle BGA = \angle BIG$

$AB \parallel CD \Rightarrow \angle CEJ = \angle BAG$

$\Rightarrow \angle CJG = \angle BAG$

$$\Rightarrow \triangle CGJ \sim \triangle BGA \Rightarrow \frac{CJ}{BA} = \frac{CG}{BG}$$

又CJ=CE， $\frac{DE}{CE} = \frac{CF}{BF} = \frac{CG}{BG}$ (角平分线第二定理)

$$\Rightarrow \frac{DE}{CE} = \frac{CE}{BA}$$

设CF=DE=x，BF=CE=1

则AB=BC=CD=DA=x+1

$$\Rightarrow \frac{x}{1} = \frac{1}{x+1} \Rightarrow x = \frac{\sqrt{5}-1}{2}$$

**方法5：等腰转化法**

在AE的延长线上取点K，连接CK，

使CK=CG，则 $\angle CKG = \angle CGK$

GF平分 $\angle BGC$ ，设 $\angle CGF = \angle BGF = \alpha$

$\angle CGE = 90^\circ - \alpha = \angle BGA = \angle CKG$

$AB \parallel CD \Rightarrow \angle CEK = \angle BAG$

$$\Rightarrow \triangle CEK \sim \triangle BAG \Rightarrow \frac{CE}{BA} = \frac{CK}{BG}$$

又CK=CG， $\frac{DE}{CE} = \frac{CF}{BF} = \frac{CG}{BG}$ (角平分线第二定理)

$$\Rightarrow \frac{DE}{CE} = \frac{CE}{BA}$$

设CF=DE=x，BF=CE=1

则AB=BC=CD=DA=x+1

$$\Rightarrow \frac{x}{1} = \frac{1}{x+1} \Rightarrow x = \frac{\sqrt{5}-1}{2}$$

**方法6：内三垂全等结合平行相似法**

过点C作 $CR \perp DF$ 于点R，并延长CR交BG于点S，

过点B作 $BT \perp CS$ 交CS的延长线于点T。

易证： $\triangle ADG \cong \triangle DCR \cong \triangle CBT$

则： $DG = CR = BT$ ， $DR = CT$

$$EG \parallel CR \Rightarrow \frac{DE}{CE} = \frac{DG}{GR}$$

设DG=x，GR=1

GF平分 $\angle BGC$ ， $GR \perp CS$ ，易得： $SR = CR$

则 $DG = CR = SR = BT = x$ ， $ST = 1 - x$

$$BT \parallel GR \Rightarrow \triangle BST \sim \triangle GSR \Rightarrow \frac{BT}{GR} = \frac{ST}{SR}$$

$$\Rightarrow \frac{x}{1} = \frac{1-x}{x} \Rightarrow x = \frac{\sqrt{5}-1}{2}$$

方法7：相似转化法

分别过点B、C向直线AE作垂线
垂足分别为点L、M.

则 $\angle CMG = \angle BLG = \angle BLA = 90^\circ$

GF平分 $\angle BGC$, 设 $\angle CGF = \angle BGF = \alpha$

$\angle CGE = 90^\circ - \alpha = \angle BGA$

$$\Rightarrow \triangle CGM \sim \triangle BGL \Rightarrow \frac{CM}{BL} = \frac{CG}{BG}$$

$$\text{易证: } \triangle CEM \sim \triangle BAL \Rightarrow \frac{CM}{BL} = \frac{CE}{BA}$$

$$\text{又 } \frac{DE}{CE} = \frac{CF}{BF} = \frac{CG}{BG} \text{ (角平分线第二定理)}$$

$$\Rightarrow \frac{DE}{CE} = \frac{CE}{BA}$$

设 $CF = DE = x$, $BF = CE = 1$

则 $AB = BC = CD = DA = x + 1$

$$\Rightarrow \frac{x}{1} = \frac{1}{x+1} \Rightarrow x = \frac{\sqrt{5}-1}{2}$$

方法8：镜面角结合相似转化法

延长BG交CD于点P

GF平分 $\angle BGC$, 设 $\angle CGF = \angle BGF = \alpha$

$\angle CGE = 90^\circ - \alpha = \angle BGA = \angle PGE$

$$\Rightarrow \frac{PG}{CG} = \frac{PE}{CE} \text{ (角平分线第二定理)}$$

$AB \parallel CD \Rightarrow \triangle GPE \sim \triangle GBA$

$$\Rightarrow \frac{PG}{BG} = \frac{PE}{BA}$$

$$\Rightarrow \frac{CG}{BG} = \frac{CE}{BA}$$

$$\text{又 } \frac{DE}{CE} = \frac{CF}{BF} = \frac{CG}{BG} \text{ (角平分线第二定理)}$$

$$\Rightarrow \frac{DE}{CE} = \frac{CE}{BA}$$

设 $CF = DE = x$, $BF = CE = 1$

则 $AB = BC = CD = DA = x + 1$

$$\Rightarrow \frac{x}{1} = \frac{1}{x+1} \Rightarrow x = \frac{\sqrt{5}-1}{2}$$

方法9：镜面角结合相似转化法

延长CG交BA的延长线于点Q

GF平分 $\angle BGC$ ，设 $\angle BGF = \angle CGF = \alpha$

$\angle BGA = 90^\circ - \alpha = \angle CGE = \angle QGA$

$\Rightarrow \frac{BG}{QG} = \frac{BA}{QA}$ (角平分线第二定理)

$CE \parallel BQ \Rightarrow \triangle CGE \sim \triangle QGA$

$\Rightarrow \frac{CG}{QG} = \frac{CE}{QA}$

$\Rightarrow \frac{CG}{BG} = \frac{CE}{BA}$

又 $\frac{DE}{CE} = \frac{CF}{BF} = \frac{CG}{BG}$ (角平分线第二定理)

$\Rightarrow \frac{DE}{CE} = \frac{CE}{BA}$

设 $CF = DE = x$, $BF = CE = 1$

则 $AB = BC = CD = DA = x + 1$

$\Rightarrow \frac{x}{1} = \frac{1}{x+1} \Rightarrow x = \frac{\sqrt{5}-1}{2}$
